

Animation Path Fixer

File path: Assets/UIAnimationToolkit/Editor/Animation/Anim_PathFixer.cs
Menu: Tools > UI Animation Toolkit > Animation > Animation Path Fixer

Overview

Repair broken AnimationClip binding paths after hierarchy nodes are moved or renamed. The tool analyzes missing paths, infers an old-to-new prefix rule and previews matched and unmatched bindings before applying the repair.

How to use

1. Open the affected clip in the Animation window with the relevant scene hierarchy available. Check the current clip and animation-root information.
2. For a moved node, drag its new parent into New Parent. For a renamed node, drag the renamed node itself. Matching runs automatically; Match reruns it.
3. Review Old Path Prefix, New Path Prefix, Automatically Matched and Unmatched. These prefix fields are read-only previews in the current script.
4. When the inferred rule is correct, click Confirm and Apply Repair. Click Analyze again if you change the hierarchy after the first analysis.

Interface and parameters

Result

3 matched / 1 unmatched

Confirm and Apply Repair

English interface schematic with example paths and counts.

Control / parameter	Description
Current Clip / root info	Automatically detected context; verify this before matching.

Control / parameter	Description
Analyze	Refresh broken-binding analysis.
New Parent	New parent of a moved node, or the renamed node itself.
Match	Recalculate the proposed mapping from the assigned object.
Old / New Path Prefix	Read-only inferred replacement rule; the older guide's manual-edit claim does not apply to this version.
All Broken Paths	Bindings whose target paths could not be resolved.
Automatically Matched	Bindings that can be repaired with the inferred rule.
Unmatched	Bindings requiring manual investigation.
Confirm and Apply Repair	Apply the valid replacement rule to the clip and save the asset.

Notes

- Unmatched bindings are not automatically deleted or rebuilt. Repair them manually as appropriate.
- If no common rule can be inferred, try a more specific parent or renamed node. Review the preview; automatic matching does not cover every hierarchy change.
- The script edits serialized binding paths and associated hashes rather than rebaking curves. Back up valuable clips and validate results in your target Unity version.
