

Frame Offset

File path: Assets/UIAnimationToolkit/Editor/Animation/Anim_FrameOffset.cs

Menu: Tools > UI Animation Toolkit > Animation > Frame Offset

Overview

Stagger selected keyframes or complete property curves by a specified frame offset. Use Forward, Backward or seeded Random offsets. Treat every property separately, or group selected properties by GameObject path to offset related rotation, scale and opacity together.

How to use

1. Open the target clip and select at least two property units, or at least two GameObject-path groups. Select actual keys to move only those keys.
2. Set the Animation-window playhead to the intended anchor time. The current script first aligns each processed curve's earliest selected key (or first curve key in property-row mode) to this time.
3. Choose Forward, Backward or Random. Enter OFFSET (frames), or MAX OFFSET (frames) for Random.
4. Choose Per Property or Group by Path. Set RANDOM SEED when using Random.
5. Confirm the detected mode and unit count, then click Apply Frame Offset.

Interface and parameters

English interface schematic replacing the older mixed-language screenshot.

Control / parameter	Description
Forward	Unit i receives +i x N frames after anchor alignment.
Backward	Unit i receives -i x N frames after anchor alignment; this is not merely reversing a list.

Control / parameter	Description
Random	The first unit has zero extra offset; other units receive integer offsets in $[-N, +N]$, using the seed.
OFFSET / MAX OFFSET	Non-negative integer spacing, or maximum absolute random offset. Frame duration comes from the clip frame rate.
RANDOM SEED / New Seed	Control repeatable random offsets or generate a new seed.
Per Property	Each selected property is a separate offset unit.
Group by Path	Selected properties sharing a GameObject path receive the same extra stagger.
Selection indicator	Keyframe mode moves selected keys only; property-row mode moves all keys on selected curves.
Apply Frame Offset	Write the shifted result to the clip. Undo is recorded.

Notes

- Zero extra offset on the first unit does not necessarily mean it stays at its old time: the initial alignment to the playhead can still move it.
- Grouped curves share the extra stagger, but each curve is aligned using its own anchor. Existing differences between their anchor times may therefore be removed.
- Repeated Apply operations use the current keys and playhead. Undo before comparing alternative settings.
