

Keep Last Frame Only

File path: Assets/UIAnimationToolkit/Editor/Animation/Anim_KeepLastFrameOnly.cs

Menu: Tools > UI Animation Toolkit > Animation > Keep Last Frame Only

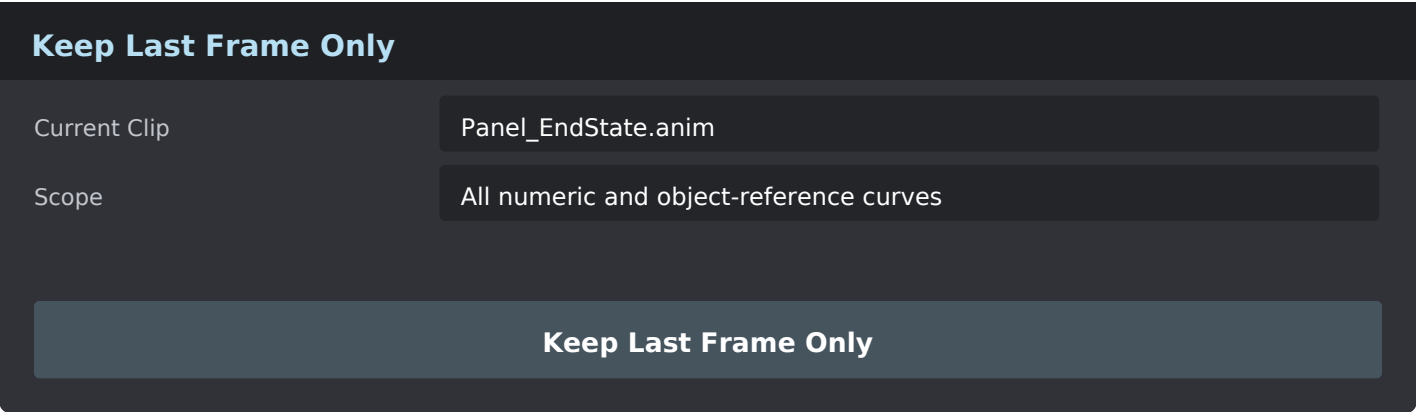

Overview

Convert the current clip to a one-key-per-property state by keeping each curve’s last stored key and moving it to time zero. Both numeric curves and object-reference curves are processed. Useful for creating a static state clip from the end values of an existing animation.

How to use

1. Duplicate the source clip if you need to retain its original animation.
2. Open the intended clip in the Animation window. If no active Animation-window clip is detected, selecting an AnimationClip asset in Project can supply it instead.
3. Open the tool and verify Current Clip. An active Animation-window clip takes priority over the Project selection.
4. Click Keep Last Frame Only. The entire clip’s supported curves are processed, regardless of selected keys.
5. Inspect the resulting keys at time zero. The asset is saved automatically; use Undo to restore the recorded clip state if the operation was unintended.

Interface and parameters

Interface schematic based on the current source.

Control / parameter	Description
Current Clip	Read-only clip reference; verify before applying.
Keep Last Frame Only	Keep the last key on each non-empty curve, set its time to zero, replace that curve and save the asset.
Disabled button	No clip could be detected.

Example

A position curve contains values 0, 50 and 100 at times 0, 0.5 and 1 seconds. The result is one key at time 0 with value 100. A Sprite/object-reference curve similarly retains its final referenced object at time 0.

Notes

- This is a whole-clip operation. It is not restricted to selected keys or property rows.
- Every curve uses its own last stored key, even when curve end times differ.
- Only curve keys are rewritten. Animation events and other clip settings are not cleared by this command; inspect them separately if creating a static state asset.
- The operation records Undo and calls SaveAssets. Unlike Apply Last Frame, it changes the clip instead of writing the scene pose.
