

Posterize Time

File path: Assets/UIAnimationToolkit/Editor/Animation/Anim_PosterizeTime.cs

Menu: Tools > UI Animation Toolkit > Animation > Posterize Time

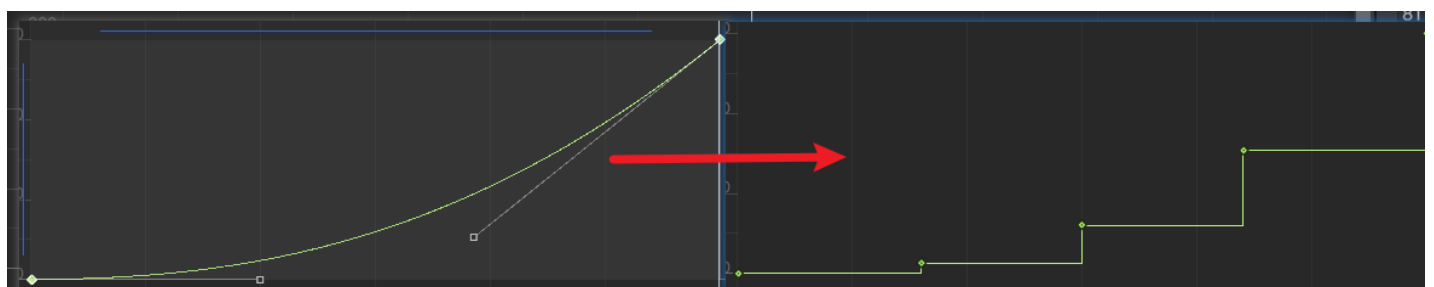

Overview

Resample selected animation curves at a target rate to create a low-frame-rate or stop-motion appearance. The tool samples the original curve over the processed interval, rebuilds the result and assigns Constant tangents so values hold between keys. It changes curve sampling, not the application frame rate.

How to use

1. Open a clip in the Animation window. Select specific keys, or select property rows in the left-hand list.
2. Enter TARGET FPS, for example 4 for four samples per second.
3. Check the detected selection mode and curve count, then click Apply Posterize. Use Unity Undo to restore the previous curve if needed.

Interface and parameters

Supplied example: a smooth curve becomes a stepped curve.

Posterize Time

TARGET FPS	4
Selection mode	Property rows - entire curves
Status	1 curve ready

Apply Posterize

English interface schematic; not a Unity screenshot.

Control / parameter	Description
TARGET FPS	Sampling rate used for the processed interval.
Keyframe mode	Activated when individual keys are selected; process the selected time span per curve.
Property row mode	Activated from selected property rows; process their complete curves.
Apply Posterize	Write the processed curves to the clip; Undo is recorded.

Notes

- The processed part of the curve is rebuilt. Undo before trying a different target FPS if you want to resample the original motion rather than the already-posterized result.
- Keyframe selection takes priority over property-row selection. Inspect the mode indicator before applying.
- The script also has handling for object-reference curves; do not treat their values as interpolated numeric properties.
