

Asset Favorites

File path: Assets/UIAnimationToolkit/Editor/AssetBrowsers/AssetFavorites.cs

Menu: Tools > UI Animation Toolkit > Asset Browsers > Asset Favorites

Overview

Collect project assets in one favorites browser without moving their original files. Supports automatic type categories, nested custom folders, grid/list views, search and drag-based organization. Common Unity asset types such as Prefabs, textures, animations, materials and audio can be bookmarked.

How to use

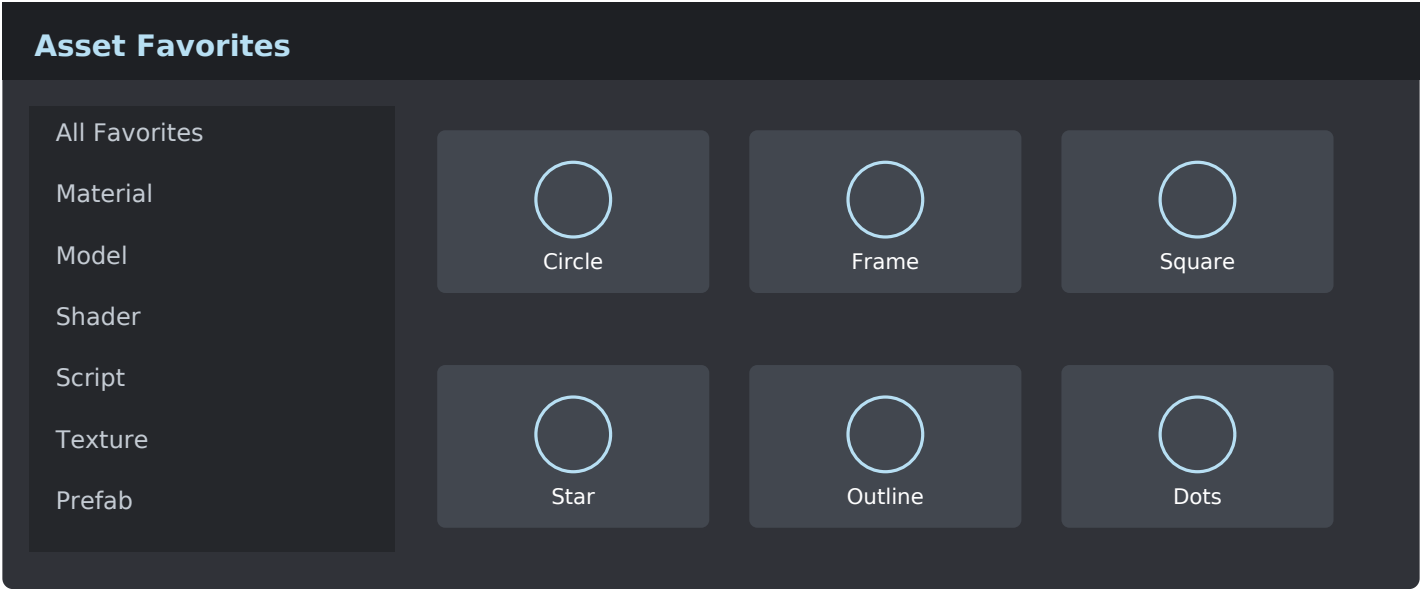

Method A - Project context menu

1. Select asset(s) in the Project window.
2. Choose UI Animation Toolkit > Add to Favorites from the context menu.
3. Review the added-count message. Already-bookmarked assets are skipped.

Method B - drag into the window

1. Open Asset Favorites.
2. Drag assets or folders from Project into the right-hand content area.
3. When a category/folder is selected, assets are added there; otherwise they are categorized by type.

Interface and parameters

English layout schematic replacing the older screenshot with Chinese folder labels.

Control / parameter	Description
Left folder tree	Browse automatic categories and nested folders. Arrow keys navigate the tree.
Divider	Resize the folder tree and content area.
Search / view sizing	Find favorite assets and switch between thumbnail and compact views.
Ctrl / Shift selection	Select multiple items in the content area.
Drag selection to a folder	Reorganize favorites without relocating original assets.
Single-click / double-click	Locate an asset in Project / open it.
Drag an asset outward	Use the asset in the Scene or another compatible drop target.

Notes

- Removing a favorite or deleting a favorites folder removes bookkeeping relationships, not original project asset files. This differs from Particle Browser’s destructive imported-folder removal.
- Favorites are saved in EditorPrefs, local to the computer; Windows uses the registry. They do not travel with project version control and are not automatically migrated between machines or installations.
- The current tool does not provide a dedicated favorites export/import workflow. Do not assume Quick UI Builder’s JSON controls export this data.
- Existing category names and user-created folder names remain user data; installing the English scripts does not rename them.
