

Prefab Browser

File path: Assets/UIAnimationToolkit/Editor/AssetBrowsers/PrefabBrowser.cs

Assets/UIAnimationToolkit/Editor/AssetBrowsers/PrefabPreviewRenderer.cs

Menu: Tools > UI Animation Toolkit > Asset Browsers > Prefab Browser

Overview

A dedicated Prefab browser with a folder tree, search, thumbnails and grid/list views. Quickly locate, open or drag Prefabs without repeatedly navigating the Project window. Thumbnail jobs are processed incrementally to keep browsing responsive; search waits 0.3 seconds after typing.

How to use

1. Open the window. The left tree lists folders that contain Prefabs directly or in their descendants.
2. Select a folder to search within that folder and its subfolders.
3. Enter a name or path query in the search field. Results update after the short typing delay.
4. Move the bottom-right zoom slider to change thumbnail size. Small sizes switch automatically to a compact list.
5. Single-click a Prefab to locate it in Project, double-click to open it, or drag it into your workflow.

Search rules

The last slash separates the path portion from the filename portion. Text before that slash must appear as one contiguous substring of the full asset path. Text after it is split by spaces: every token must appear in the filename (AND matching). Comparisons are case-insensitive. With no slash, the entire query is treated as filename tokens.

Query	Match condition
btn	Filename contains btn.
btn red	Filename contains both btn and red.
UI/btn	Full path contains ui; filename contains btn.
UI/btn red	Full path contains ui; filename contains both btn and red.
UI/Prefabs/btn	Full path contains ui/prefabs as contiguous text; filename contains btn.
UI/	Full path contains ui; no filename restriction.

For example, R/Imag/ looks for the contiguous text r/imag. It does not independently fuzzy-match every folder segment. Root2/Image does not match that query. This corrects the older PDF example to match the current script.

Interface and parameters

Control / parameter	Description
Folder tree	Expand/collapse folders and choose the search scope. With an empty query, all Prefabs under the selected folder are shown.
Search	Filter by path substring and filename tokens.
Zoom slider	Adjust thumbnail size (64-256 px); small sizes activate list view.
Divider	Drag horizontally to resize the folder tree and content area.
Prefab cell	Thumbnail and asset name; supports locate, open and drag actions.
Status bar	Result count and selected folder information.

Notes

- Thumbnail cache: Assets/Editor/PrefabPreviews. The renderer removes older files when its cache limit is exceeded.
- Keep both helper scripts in the supplied Editor assembly. They no longer need an old loose-script folder path.
- Search scope follows the selected folder, including when a query is already entered.
