Menu: Tools > UI Animation Toolkit > Particles > Particle Browser

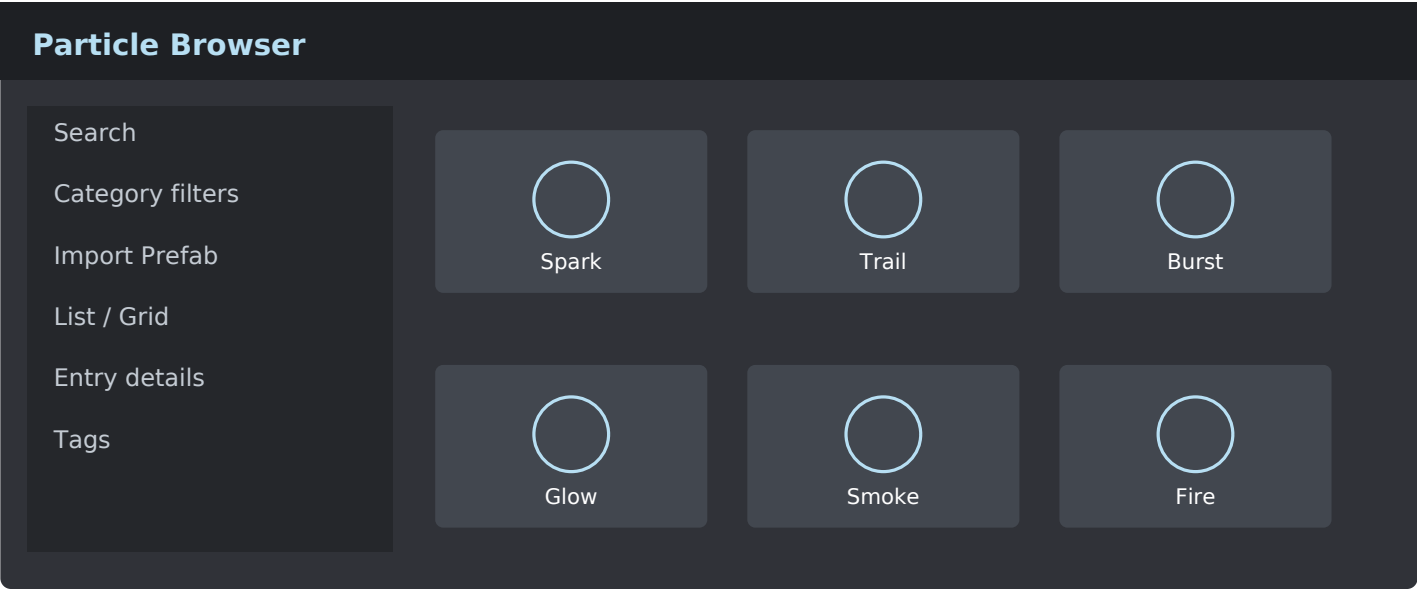

Overview

Organize particle Prefabs in a project-local library with search, category/tag filters, grid/list browsing, Scene hover previews and import/export actions. The toolkit contains the management tools, not a collection of particle effects.

How to use

1. Open Particle Browser. On first use it creates its data asset and default categories: Emission Type, Effect Type and Style.
2. Use Import Prefab or drag a supported Prefab/scene object into the window. Follow the import and naming prompts. The tool creates a managed copy in its Import directory.
3. Right-click a single entry and choose Edit Tags. Use the bottom Tags button to manage categories and tag definitions.
4. Use the search field and category filters to narrow results. Clear All Filters resets the filter choices; toggle List/Grid to change presentation.
5. Hover an entry to preview it in the Scene view. The preview uses an existing Canvas or creates a temporary World Space Canvas and may center the Scene view on it.
6. Drag an entry out for scene use, or right-click one entry to export to the default or a chosen folder. The single-selection details panel also provides Export.

Interface and parameters

Workflow schematic based on current source; example effects are not included assets.

Control / parameter	Description
Search / category filters	Filter by name and tags. Filters from different categories must all match.
Import Prefab	Choose a Prefab to add to the managed library.
Grid / List	Switch the content presentation.
Hover preview	Simulate particle systems in the Scene view; temporary preview objects are cleaned up on exit.
Tags	Manage categories and tag definitions. Default categories cannot be deleted.
Edit Tags / Rename	Single-entry context actions.
Show in Project	Locate the managed Prefab asset.
Export to Default Folder / Export to...	Export one selected entry to the default or chosen location.
Remove from Favorites	Remove selected entries and delete their managed Import folders after confirmation.

Data and helper scripts

File	Responsibility
ParticleBrowser.cs	Main window, selection, drag/drop, context actions and preview integration.
ParticleBrowserData.cs	ScriptableObject entries, categories, tags and data access.
ParticleBrowser_Filter.cs	Filter popup, tag editors/managers and naming window.
ParticleBrowser_Import.cs	Import/export helpers, supported dependency copying/remapping and entry renaming.
ParticleBrowser_Preview.cs	Temporary preview instances and simulation lifecycle.

Database: Assets/ParticleBrowser/Data/ParticleBrowserData.asset. Managed imports: Assets/ParticleBrowser/Import. Default exports: Assets/ParticleBrowser/Export. These paths were retained during product restructuring to preserve existing libraries.

Notes

- Remove from Favorites is destructive here: it deletes the entry’s managed Import folder, and the confirmation states it cannot be undone. This differs from Asset Favorites, which only removes bookmarks.
- Import/export copies the resource types implemented by the helper, including supported material/mesh handling. It is not a guarantee of complete dependency packaging for every effect or third-party component.
- Back up the data asset, imported assets and their .meta files together when transferring the library. Do not copy only the database.
- Preview runs in the Scene through temporary objects; it is not an in-window rendered video and does not certify final in-game rendering.
- Multi-selection supports organization/removal; the export and tag-edit context actions described above require a single selection.
