Menu: Tools > UI Animation Toolkit > UI > Quick UI Builder

Overview

A dockable toolbar for creating common UI nodes, renaming selections and adding components. Custom component buttons can be configured and transferred through JSON. Resize the window to arrange custom buttons into multiple columns.

How to use

1. Select the target objects in the Hierarchy and open Quick UI Builder.
2. Use Rename to batch-rename selected objects and add numeric suffixes.
3. Click a Create button for a sibling below the selected object, or hold Alt to create a child. Shift-click Empty to wrap the selection in an empty parent.
4. Use Pivot for a 3x3 preset grid, or the Component buttons to add supported components.
5. Use the bottom + button to add your own component shortcuts. Right-click it to import or export the custom-button list.

Interface and parameters

Quick UI Builder	
RENAME	Rename
CREATE	Empty Image Text Particle
PIVOT	Pivot
COMPONENT	CanvasGroup RectMask2D
CUSTOM	User-defined component buttons
Add Custom	Left-click: add; right-click: JSON

English interface schematic replacing the low-resolution toolbar screenshot.

Control / parameter	Description
Rename	Open the naming popup for selected objects; numbering follows hierarchy order.
Empty	Create a GameObject with RectTransform. Alt: child. Shift: empty parent wrapper.
Image	Create a node with a UGUI Image. Alt: child.
Text	Create Legacy Text with white text, size 24 and centered alignment. Alt: child.
Particle	Create a node with a ParticleSystem. Alt: child.
Pivot	Open PivotPopup; choose one of nine RectTransform pivot presets.
CanvasGroup	Add CanvasGroup to selected objects, skipping objects that already have one.
RectMask2D	Add RectMask2D to selected objects, skipping existing components.
Bottom + / Add Custom	Search for a component type, set a display name and create a shortcut.
Right-click +	Export to JSON or Import from JSON.
Click a custom entry	Add that component to the selected GameObject(s).
Right-click a custom entry	Edit its display name/type or delete the shortcut.
Right-side drag handle	Adjust toolbar width; custom entries flow into additional columns.

Notes

- CustomCompStore saves settings in EditorPrefs: these are local to the computer (the registry on Windows), not version-controlled project assets. Use JSON export/import to transfer them.
- Importing JSON replaces the current custom-button list. Export a backup first if you want to preserve it.
- The optional Samples/Presets/QuickUIBuilder_CustomComps.json configures a sample component button. The corresponding component type must exist in the project.
- The main window depends on all four helper scripts listed above; they are one tool, not five independent utilities.
